

Project Design Phase-II
Technology Stack (Architecture & Stack)

Date	18 October 2022
Team ID	PNT2022TMID32631
Project Name	Retail Store Stock Inventory Analytics
Maximum Marks	4 Marks

Technical Architecture:

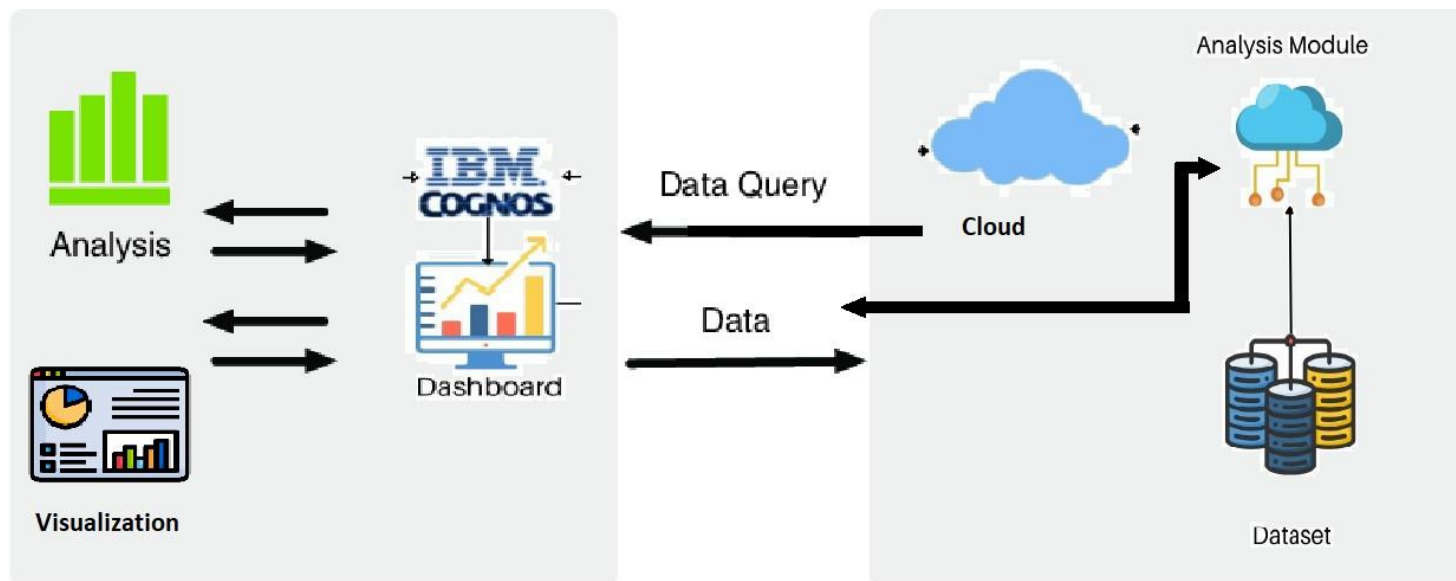

Table-1 : Components & Technologies:

S.No	Component	Description	Technology
1.	Importing data	Data is imported from external sources and is used for analytics.	Cognos Analytics Tool
2.	Data Cleaning and Preprocessing	Data cleaning is a process by which inaccurate, poorly formatted, or otherwise messy data is organized and corrected it. Data pre-processing, a component of data preparation, describes any type of processing performed on raw data to prepare it for another data processing procedure.	Cognos Analytics Tool
3.	Training data	Training data is the subset of original data that is used to train the machine learning model.	Cognos Analytics Tool
4.	Testing data	Test data is data which has been used to check the accuracy of the ML model.	Cognos Analytics Tool
5.	Building model	Building a machine learning model to predict the disease from the data using machine learning algorithms.	Cognos Analytics Tool
6.	Model training	Train the model using the Train and Test data.	Cognos Analytics Tool
7.	Model performance evaluation	One metric for measuring classification model performance is accuracy. Accuracy is formally defined as the percentage of correct predictions made by our model.	Cognos Analytics Tool
8.	Checking accuracy	A data accuracy check is a set of quality validations that take place before using data.	Cognos Analytics Tool

Table-2: Application Characteristics:

S.No	Characteristics	Description	Technology
1.	Open-Source Frameworks	Frameworks are about more than just creating a development environment. They help to define a set of standards that programmers can follow when working collectively. When programmers choose a certain framework, they adopt the specific tools and methodologies associated with that framework. This also means they must be mindful of your choice, as they may end up with processes that don't fit the needs of their project or the developers involved.	Metadata modeling tool
2.	Security Implementations	IAM Controls and Encryptions are implemented to improve security of the application.	IBM Cognos software security
3.	Scalable Architecture	Scalable operations are implemented using APIs like HTTP, HTTPS.	Planning Services, API Gateway
4.	Availability	To ensure high availability and optimal service, the load balancer performs continual health checks of each server in the cluster, using probes to determine its eligibility for requests.	Server Load Balancers
5.	Performance	Performance of the system is increased using caching methodology.	Caching
